

The Action-Vocabulary-Forge

Turning any system into a decision-ready interface for the JEV

Not an agent.
Not a wrapper.
The missing piece.

1. THE EXECUTIVE'S QUESTION

I keep hearing about the "action-vocabulary-forge". Does it inject the JEV into any system?

Good question. Short answer: No, it doesn't inject. It fabricates the piece that fits.

2. WHAT IT ACTUALLY DOES

The Forge is a **compiler of decisions**. It reads a system (code, API, UI, docs, logs), finds where complex context is reduced to a few possible actions, and compiles that into an **Action Bundle**.

From that bundle, it generates an **adapter** that calls the JEV for the semantic choice and keeps all the rules in deterministic code.

3. WHAT IT IS NOT

- Not an autonomous agent**
The JEV never plans, never calls tools, never expands the options.
- Not a system wrapper**
Your system stays your system. The Forge delivers a Python module your system calls at a decision point.
- Not an action inventor**
Handlers are only generated when we have evidence of how to execute the action (function, API, CLI, etc).
- Not a replacement for humans**
Humans still approve releases, review labels, and resolve abstentions.

It's not magic. It's a disciplined way to connect the JEV to real systems — safely.

4. THE TWO LLMs AND THEIR ROLES

Who	When	Role
Frontier agent (Claude Code, Codex, Gemini...) following SKILL.md	Discovery (once per system, outside production)	Reads the system, writes the bundle, records evidence, labels cases for review.
JEV (jev-latest, TypeSafe)	Runtime (every decision)	Chooses one option among the legal ones, with confidence and probabilities. Only that.
Code (Forge + adapter)	Compilation and runtime	Validates bundle, filters illegal actions, applies policy, executes, logs, calibrates, evaluates.
Human	Before and after	Approves the gate, reviews labels, resolves abstentions.

Open intelligence works outside production.
In production, only the closed JEV runs — surrounded by code.

5. WHAT GOES IN → WHAT COMES OUT

Input: a real system and a scope

- Code repository
- API spec or MCP
- UI / DOM
- SOPs and documentation
- Logs and traces
- Test cases

Output: action-bundle/

- surface_candidates.yaml
- action_registry.yaml
- state_registry.yaml
- transition_graph.yaml
- decision_surfaces.yaml
- evidence_ledger.jsonl
- jev_adapter_spec.yaml
- coverage_report.md
- generated_adapter.py
- decision_log.jsonl
- labels.jsonl

This bundle documents the decision space and includes a generated adapter your system can call.

6. A CONCRETE EXAMPLE

From the action_registry.yaml:

```
- action_id: route_hedge_coverage_corn
  description: Route the question to contract us-crop-hedge-coverage for corn.
  choose_when: User asks whether to change, hold, add to, or reduce hedge coverage for US corn.
  do_not_choose_when: Another crop, a price question, or no crop at all.
  preconditions:
    - registry_issue_count == 0
    - contract_status == 'active'
    - historical_market_year == false
  parameters:
    - {name: contract, required: true}
    - {name: crop, required: true}
  binding:
    type: python_function
    import_path: decision_contracts.routers
    function: route_to_contract
```

Each action has clear rules, preconditions, and a verified way to execute it.

7. HOW IT WORKS AT RUNTIME

So the JEV only chooses among legal options, and the code handles everything else?

Exactly. Safe, predictable, and auditable.

8. WHY IT MATTERS

- 🚀 Unlocks the JEV for real-world systems without risky free-form agents.
- 📊 Creates a clear, documented decision space.
- 🛡️ Safe by design: only legal actions, with preconditions and thresholds.
- 🔍 Evidence-based: every claim is traceable.
- ⚙️ Portable: the same pattern works for APIs, UIs, internal tools, and more.
- 🎯 Faster, more consistent decisions at scale.

9. THE BOTTOM LINE

So the Forge doesn't inject the JEV into my system. It builds the missing piece so the JEV can fit — safely and productively.

That's right. A documented decision interface, not a black box. Real systems, real value.

Same system. Smarter decisions.
